

UNMATCHED TECHNOLOGY IN TODAY'S TOWABLE RV MARKET . . .

THE CENTER POINT AIR RIDE SUSPENSION SYSTEM

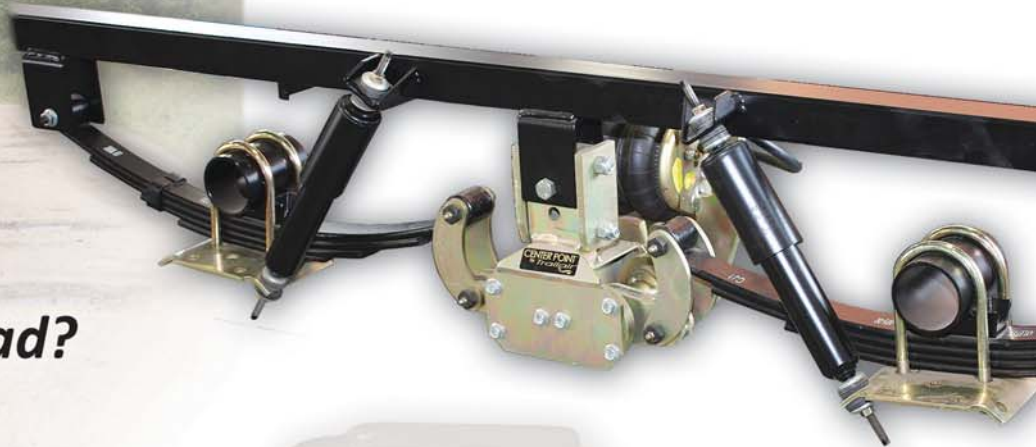

Rough roads ahead?

Over 85% of all tractor trailer rigs on the road today utilize air-ride technology. This not only includes air ride suspensions for the truck and trailer, but also air ride cabs, seats and even couplers!

You've invested a lot into your coach. Don't you deserve the same comfort and care when you're traveling across the sometimes treacherous roads of North America?

The answer is, you do, and now you can have it affordably with the Center Point air ride suspension system. Not only will Center Point provide a smoother ride, but it will protect your investment by reducing the potential damage caused by road shock. Check out why Center Point is unmatched in today's RV market.

Center Point will handle them!

Center Point's unique design allows one air bag to absorb opposing forces from two axles both simultaneously and instantaneously, without delay. This allows the air spring to dampen more effectively than would be possible in a traditional trailing beam suspension system that utilizes either air springs or torsolastic rubber.

Center Point's simple design cushions the RV against road shock by adding an air bag at the equalizer position between the leaf springs providing smooth, stable towing.

Key Benefits

- Improves overall ride while protecting the coach and its cargo.
- Absorbs impact caused by road shock and protects your investment.
- Easy to install and adaptable to most trailer double eye leaf spring suspensions.
- Retrofits to current suspension systems - Time to upgrade!
- Saves you money on costly repairs caused by road shock.
